14 researchers
 7 HDR (50%)
 10 full-time research
 11 PhD, 1 postdoc

- 2 associate researchers from industry (CEA Cadarache, Géolithe)
- 8 researchers from other teams (2 Failles, 2 Ondes, 3 Cycles, 1 TRB)
- 2015-2019 : 26 defended PhDs + 11 ongoing
- 2015-2019 : 6 completed post-docs + 1 ongoing

HCERES
 26-27 November 2019

From hazards to risks

Physicals models to assess hazards

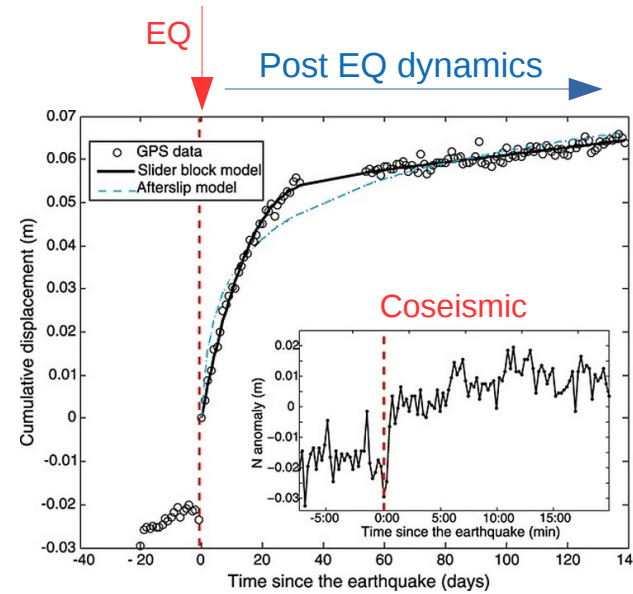

- Landslide dynamics.
- Earthquake Ground Motion.

Integration into risk studies

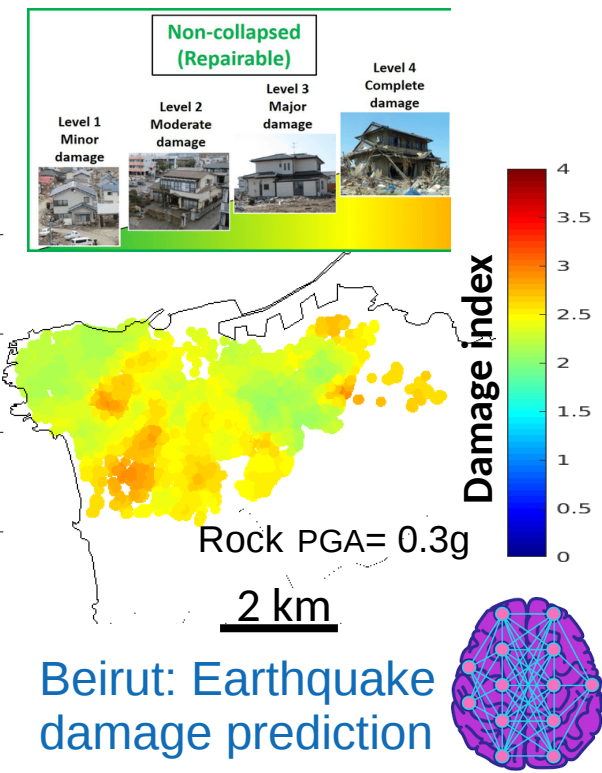

- Geophysical precursors to forecast landslides.
- Physics-based proxies & metamodels.
- New risk indices.

Our approach

- Geophysical methods (imaging, monitoring).
- Observation: remote sensing & in-situ instrumentation, short & long-term acquisition.
- Lab experiments, numerical simulation, AI tools.

Maca, Peru: Earthquake triggered landslide

Beirut: Earthquake damage prediction

SWOT analysis

- **Strengths** range and complementarity of expertises and skills; fundamental and societal research; collaborative spirit.
- **Weaknesses** seismic and landslide hazards covered by several teams; no project P.I.s at national/european level, no CNRS members.
- **Opportunities** transverse axes at ISTerre to help the structuration of hazard studies; computing group (calcul@ISTerre) to support our needs; Risk Institute + EUR Risk.
- **Threats** retirement of senior researchers; erosion of team's landslide taskforce; end of MEEES.
